

SALTIFY.

github link.

description

we look to be able to transcribe audio samples into a written format that is accepted by **SALT (systematic analysis of language transcripts)** software.

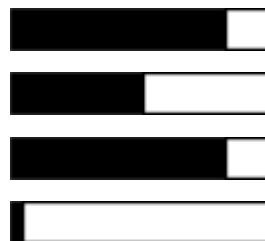

SALT is an app that analyzes the speech of children and scores it according to their metrics.

currently, SLPs can either pay for audio samples to be transcribed, a service which is too slow and expensive, or do it manually, which takes a considerable amount of time.

unlike any programs currently available, our app will allow SLPs to quickly convert audio to SALT formatted text for free
